Polyonics introduces Polyimide, Kapton and circuit board label materials

by
Sep 02, 2003

Polyonics Inc. has introduced a family of Polyimide, Kapton and circuit board label materials.

PCB labels (also known as Polyimide, Kapton and PCB labels) may require Kapton label materials that can withstand process temperatures in excess of 250°C. These Polyimide or Kapton label products, printed with the appropriate thermal transfer printer and thermal transfer ribbon, can survive a wide variety of fluxes, cleaners and other chemicals without lamination by a label lamination machine.

Polyonics' THERMOGARD products are said to provide the broadest cost/benefit choices available today, offering Polyimide, Kapton, modified Polyimide and Polyester label materials for barcode label applications. Additionally, colored versions of some Polyimide label materials are available.
